
Scores
History / trajectory value (preference on paths)
encodes full record
Lexicographic priority (on criteria vector)
specializes strict priority
specializes ignores the record
encodes exact on records if the record sees the route
Record-carrying state (state × record of the walk)
specializes utility on states; induces exact r on edges
Additive route value (path sum on edges)
isomorphic summand exact part
specializes
Exact potential summand (endpoint-only routes)
projects long-run average retains this summand
incompatible fixed U rejects updates that lower its chosen outcome
Act approval score (Protocol · one edge)
specializes one edge, one judge
isomorphic summand cycle part
Cycle residue summand (round trips matter)
incompatible nonzero round trip (state carries no record)
Quantilizer (retained quantile of base)
limit quantile to the maximum
Outcome lottery (expectation or risk functional)
projects expectation
State utility (scalar order on states)
encodes if the procedure is scored only by its output
incompatible protecting the channel means seeking correction unless the record sees the channel
projects chosen rates
specializes rates fixed
Criteria vector (Pareto · task costs/stakeholders)
Fixed-rate sum (fixed exchange rates)
incompatible if one goal is spent to raise another
composes route residue inside the region
incompatible unless an exact penalty exists
Relations and capacities
Open procedure target (CEV · unset output)
limit forced halt at a scored output
Human AU landscape on–off floor (non-obs.)
composes pointwise floor on one landscape
Non-compensatory constraint (forbid traded violations)
composes admissible region
Correction relation (handles + channel profile)
specializes one handle, named operators
Corrigibility handles (shutdown / modification)
projects shutdown bit
composes only the represented relation
Human AU landscape soft penalty (AUP)
composes same landscape, soft penalty
Agent empowerment channel (options / influence)
incompatible when the option pool does not grow
Human-power aggregate (capacity order)
composes positive direction inside the region
composes viability of a supplied set
Guarantees
strengthens ∃ control to ∀ disturbance
Robust invariance (∀ disturbance in class)
incompatible if corrections count as disturbances and aim outside the set
Existential viability (∃ control in supplied K)
composes if the selector is inside the dynamics
Selection stability (signed basin · ecology)
Warrants
Control protocol (monitor under threat model)
composes one leaf
Model-relative proof (formal leaf)
composes one leaf
Safety case (deployment argument)
